Fraud Analysis

Instant Result

Find a Transaction

Enter the transaction ID to retrieve and analyze the transaction.

Transaction ID

ID

56

For the standard credit-card dataset, transaction ID represents the dataset row number.

Search Transaction

How Search Works

Fraud Intelligent retrieves the selected transaction from your dataset and sends its features through the trained Random Forest model.

- 1 Enter a valid transaction ID.
- 2 The transaction is retrieved from the dataset.
- 3 Random Forest analyzes the transaction features.
- 4 Fraud probability and risk level are displayed.

Normal Transaction

Model analysis completed successfully.

 **LOW RISK TRANSACTION**

Dataset Actual Class:  Normal

This is the actual label stored in the dataset. The prediction above is the Random Forest model result.

Random Forest

Uses your trained machine learning model to classify transactions.

Fraud Probability

Shows how strongly the model considers a transaction fraudulent.

Risk Assessment

Automatically categorizes transactions as Low, Medium, or High risk.
